

Marketing Dataset Memo - Jace Goode

This memo will summarize some important patterns in customer spending data based on recent marketing campaigns. The data is about the company, which sells a variety of household products. The visualizations will illustrate the relationships between income, household demographics, product preferences, and campaign acceptance and total customer spending.

Figure 1: Income vs Total Spending

Figure 1: Income is strongly correlated with customer income, with an association of 0.823.

Figure 2: The majority of customers spend less than \$500 overall, with a long right-tail of more high-value customers.

Figure 2: Distribution of Total Customer Spending

Figure 3: Average Spending by Product Category

Figure 3: Wine and meat products account for the majority of customer spending, with the least being spent on fruits and fish products.

Figure 4: The box plot shows that households with fewer children are more likely to be higher-value customers, with the median being above \$1000 for households with no children.

Figure 5: Customers who accept more campaigns tend to spend more overall, showing a positive relationship between engagement and value.

Figure 6: 79.2% of customers decline marketing campaigns, and only 6.2% accept more than one campaign.

Figure 6: Overall Campaign Acceptance Rate

Actionable Advice: The analysis suggests that the company should target high-income, child-free customers for more efficient marketing campaigns. Because the wines and meat products generate the most revenue, future promotions should focus on these categories rather than evenly distributing marketing resources. Finally, since most customers ignore campaigns while a small, valuable minority accepts multiple offers, the company should collect additional behavior data. This could include browsing or email engagement, which would be useful when targeting customers who are more likely to respond and engage.
